

Case Study - Alderson Community Center

“The emergency generator was turned over to the Community Center just 10 days before the flood in June, ‘16. I live pretty close to the Community Center and, when the lights went out, I heard it come on. That was such a great feeling.” - Margaret Hambrick, Alderson Community Center

Greenbrier Technologies Delivers Back-Up Generator Solutions to give peace of mind 24/7

The Situation

ACC serves as a local emergency shelter and received a grant from the WV Department of Homeland Security and Emergency Services from money passed through from FEMA and matched with state dollars to install an emergency generator.

The Challenge

ACC needed a dependable company in the area that could meet all of the grant requirements and also price the project at an affordable rate. The unit needed was required to be an industrial generator. So support and experience was also a factor

The Solution

With a knowledgeable team and a detailed approach to deciding on the best equipment for the community center's needs, Greenbrier Electric was able to win the bid and meet all of the grant requirements with ease.

The Results

The Board of the Community Center & the citizens of Alderson now have the peace of mind they deserve. When the community suffers a disaster, which requires the re-housing of its citizens, it is comforting to know that the generator will keep the community center up and running so it can meet the needs of families, as it did during the flood of 2016. The industrial generator stayed on for two weeks, powering lights & providing the shelter with hot water for showers & a place to gather for hot meals for approximately 80% of the residents.
